

Extrapolating the METR Task Horizon Data

Severin Field

AI agents now complete software tasks that take a human about four hours. That length doubled roughly every months from 2019 to 2024, and every four months since then.

Log scale, through today. The y-axis is the task length it completes with 80% reliability. This is the same chart as METR publishes it.

The same data and the same trendline, on an ordinary linear axis, carried out to 2030.

Should the trend continue unimpeded, by 2030 “doing more cognitive labor than all humans combined” is plausible. Note that half of my interviewees expected scaling trends to continue until full automation of AI research.
